DIPLOMA IN
PHARMACEUTICAL
TECHNOLOGY

EXAM SERIES : NOVEMBER 2007

Scanning electron micrograph of *Mycobacterium tuberculosis*

ABSTRACT

The study was conducted at the Ngaira Health Centre, and involved patients suffering from pulmonary tuberculosis within a four month period i.e.: from January 2007 to April 2007.

Ngaira health centre is the referral Hospital for all conditions of pulmonary tuberculosis. It was therefore a good study area because it normally has a high population of patients suffering from pulmonary tuberculosis and moreover, the management is a good representative of the situation of pulmonary tuberculosis countrywide.
