EXAM SERIES: NOVEMBER 2007

ABSTRACT

A comparative study was carried out at the casino dispensary on patients diagnosed with syphilis; this was in relation to age and sex. Patients were drawn for this study and were between five and sixty years.

Diagnosis was done and those who were tested positive were given drugs, which included procaine penicillin and erythromycin. There was no tetracycline to give patients therefore it was not prescribed.

The drug with most patients was identified. Also the prevalence and what social class most of the patients fell in. the most age bracket which was most affected was also identified.
